

METHOD AND APPARATUS FOR SECURELY PROVIDING IDENTIFICATION INFORMATION USING TRANSLUCENT IDENTIFICATION MEMBER

ABSTRACT OF THE DISCLOSURE

[0066] An apparatus and method for securely providing identification information generates one or more obscured identifiers for a recipient, such as one or more identifiers that are generated based on data unique to a recipient or other information as may be appropriate. In one embodiment, the method and apparatus generates a translucent identification member, such as a plastic card, sheet, film or other suitable member that has a translucent area that includes one or more obscured identifiers. When the translucent identification member is overlayed on a screen displaying a visual filtering pattern, one of one or more obscured identifiers is visually revealed for use during the particular transaction. The revealed identifier is entered into a recipient device and sent to an authenticator to be verified as an appropriate identifier for the transaction.
